Convnets in practice

- Several convolutional layers (5 or more)
- After the convolutional layers **non-linearities** are added (The most popular one is the ReLU)
- After the ReLU usually some pooling (Most often max pooling)
- **After 5 rounds of cascading:**
  - Vectorize the last convolutional layer (Flatten)
  - Use as Input to the first fully connected layer (FC)
  - Proceed as in a traditional classification neural network
