Suggested Positional Encoders
(Rules Controlling Good Positional Encoder)

[1] ***δ value should be same*** *for Long sequence and short sequence*
(same positions will be encoded with same values irrespective of the length of the sequence)

[2] Range of position encoded values should NOT depend on sequence length
(predefined fixed range e.g. from 0 to 1 , form -1 to 1 , ...)

[3] Position Encoding should be a VECTOR *(not scalar) and of* ***same dimension as Word Embedding***
(in order to easily combine Position Encoding and Word Encoding vectors)
