Concept of LOSS Function

Let $\mathbf{Y} = \begin{pmatrix} y_1 \\ y_2 \\ \cdots \\ y_n \end{pmatrix}_{n \times 1}$ **Original Labels** from Training Samples

Let $\hat{\mathbf{Y}} = \begin{pmatrix} \hat{y}_1 \\ \hat{y}_2 \\ \cdots \\ \hat{y}_n \end{pmatrix}_{n \times 1}$ **Predicted Labels** from Model $\hat{Y}=X\underline{W}$

Remember

$$\|a\|_2 = a^T a$$

Objective is $\hat{Y}=Y$

If $\hat{Y} \neq Y \Rightarrow$ There is an **Error (Loss)**

$\hat{\mathbf{Y}} = \boldsymbol{X}\,\boldsymbol{W}$ ***Predicted***

Where : $\boldsymbol{X}_{N \times d+1}$ is a **matrix** $\Rightarrow$ **Given**

$\boldsymbol{Y}_{N \times 1}$ is labels **vector** $\Rightarrow$ **Given**

$\boldsymbol{W}$ is Model Parameter **Required** $\Rightarrow$ **Required**

Define **Loss** function as **squared distance** between $\hat{Y}$ and Y

$$Loss = \|Y - \hat{\mathbf{Y}}\|_2 = (Y - \hat{\mathbf{Y}})^T (Y - \hat{\mathbf{Y}})$$
